AGRECOL 21-24.05.2009

Background

Multipurpose land use systems where widespread
in Swiss agricultural landscapes...

Waldweide

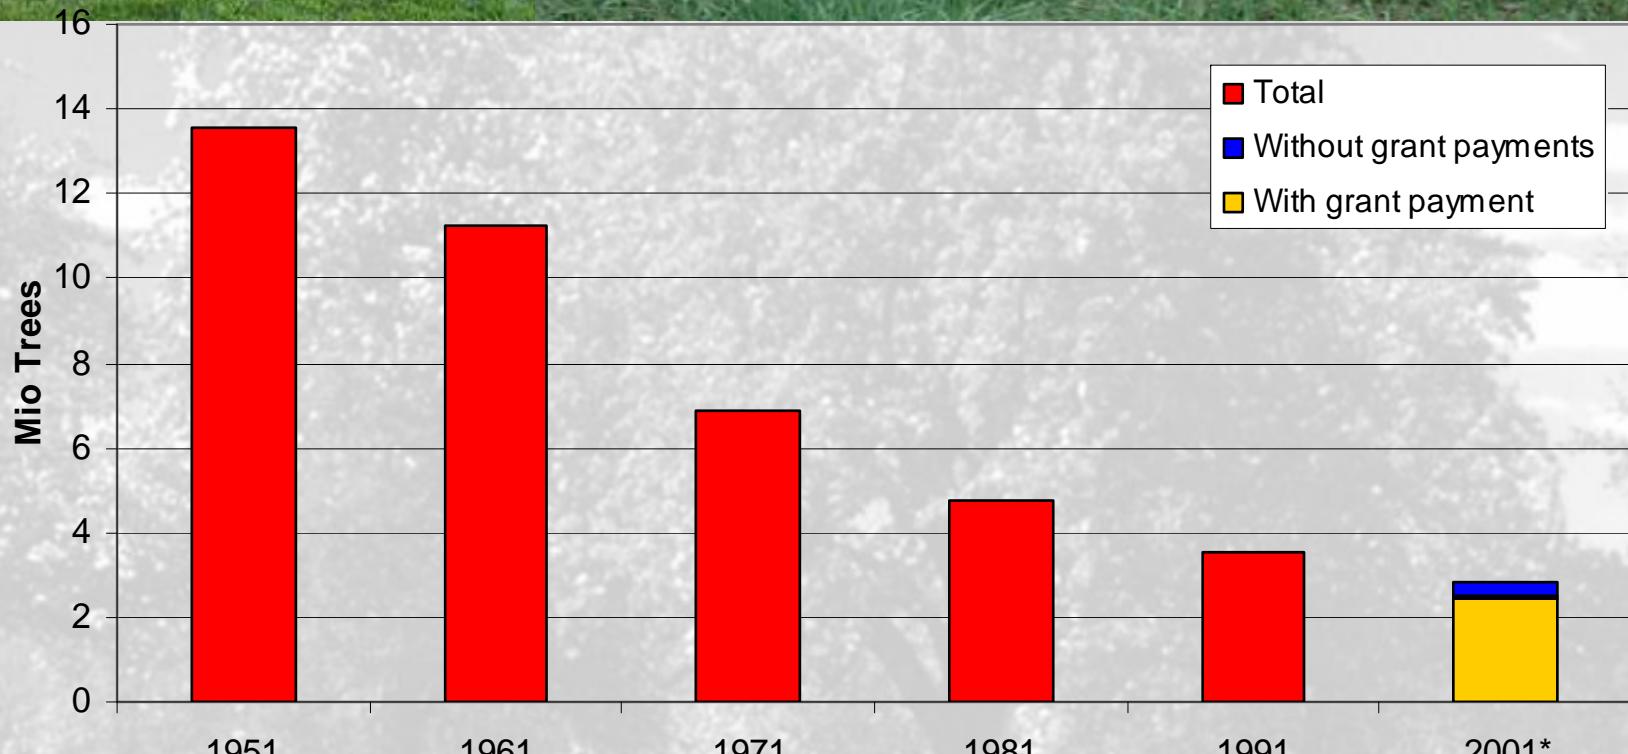

Waldweide

Today

N° of high-stem fruit trees 1951 - 2001, in Swiss agricultural landscapes

AGRECOL 21-24.05.2009

Objectives

PhD title:

**Perspectives for integrating trees into Swiss agricultural landscapes
(Part of the “BAUMGÄRTEN” project)**

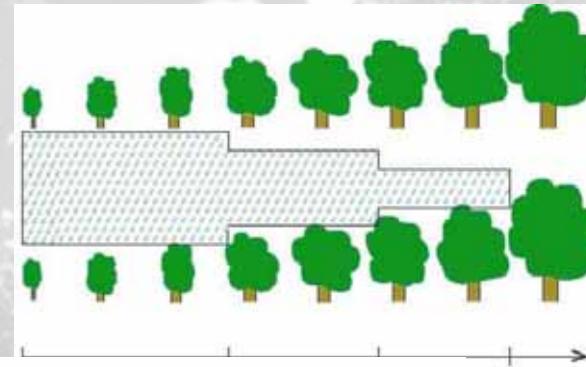

The main objectives of the PhD project are to:

- 1. Identify and design viable Agroforestry systems (AFS) for Swiss agricultural landscapes**
- 2. Assessment of productivity and profitability of the AFS**
- 3. Identify and assess the driving forces for planting trees, in close cooperation with local stakeholders and experts.**

The Agroforestry system

AFS in Switzerland

- Silvoarable AFS
- Silvopastoral AFS

The Agroforestry system

Silvopastoral
Agroforestry

Many options...

Chestnut + Animals

+ Apiculture

Sheeps

Ostriches

+
Christmas Trees

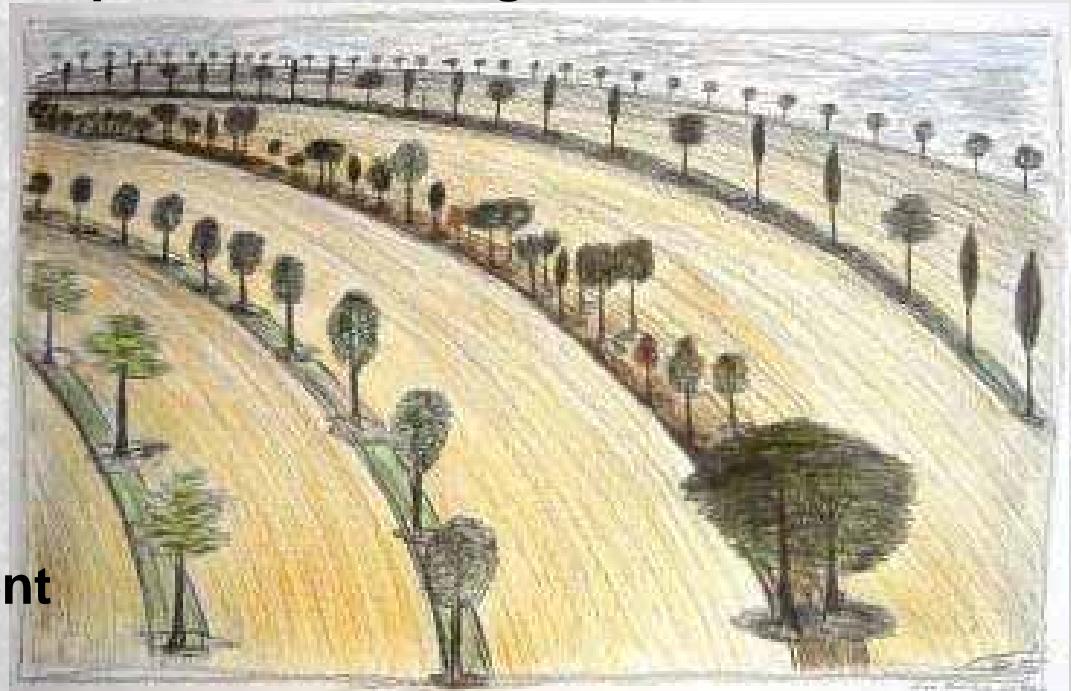

AGRECOL 21-24.05.2009

Agroforestry design & management

Objective

- Effective use of natural resources/ reduce competition
- Effective use of labour/ practicable design

1. Site Selection
2. Tree selection
3. Tree density
4. Tree arrangement
5. Crop selection
6. Tree pruning
7. Tree line management

- **What is the experience of farmers?**
- **Which agroforestry designs are viable for Switzerland?**

Method (i): Survey of farmers' innovations
yielding an inventory of alternative tree-crop or tree-grass approaches developed by farmers and practitioners.

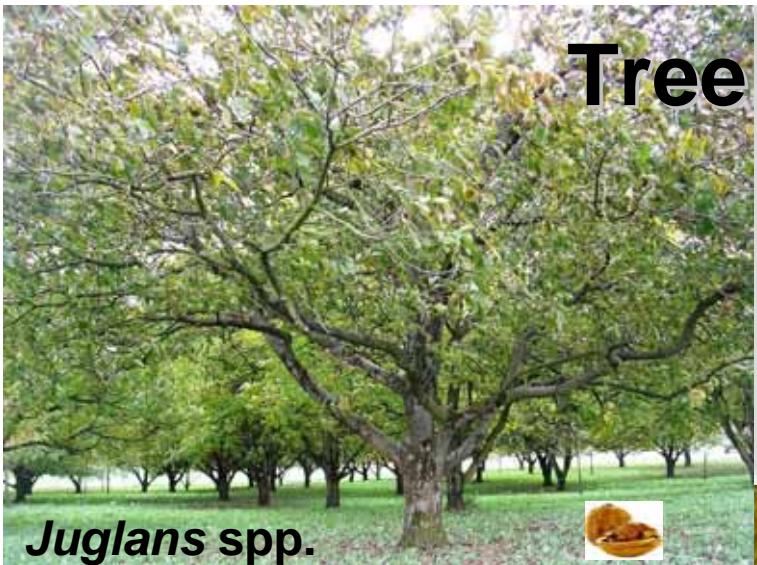

➤ Results will be published and factsheets on farmer innovations prepared in order to discuss and diffuse knowledge from best practice cases.

Farmer innovations

Castanea sativa

AF promote income from multiple regional products

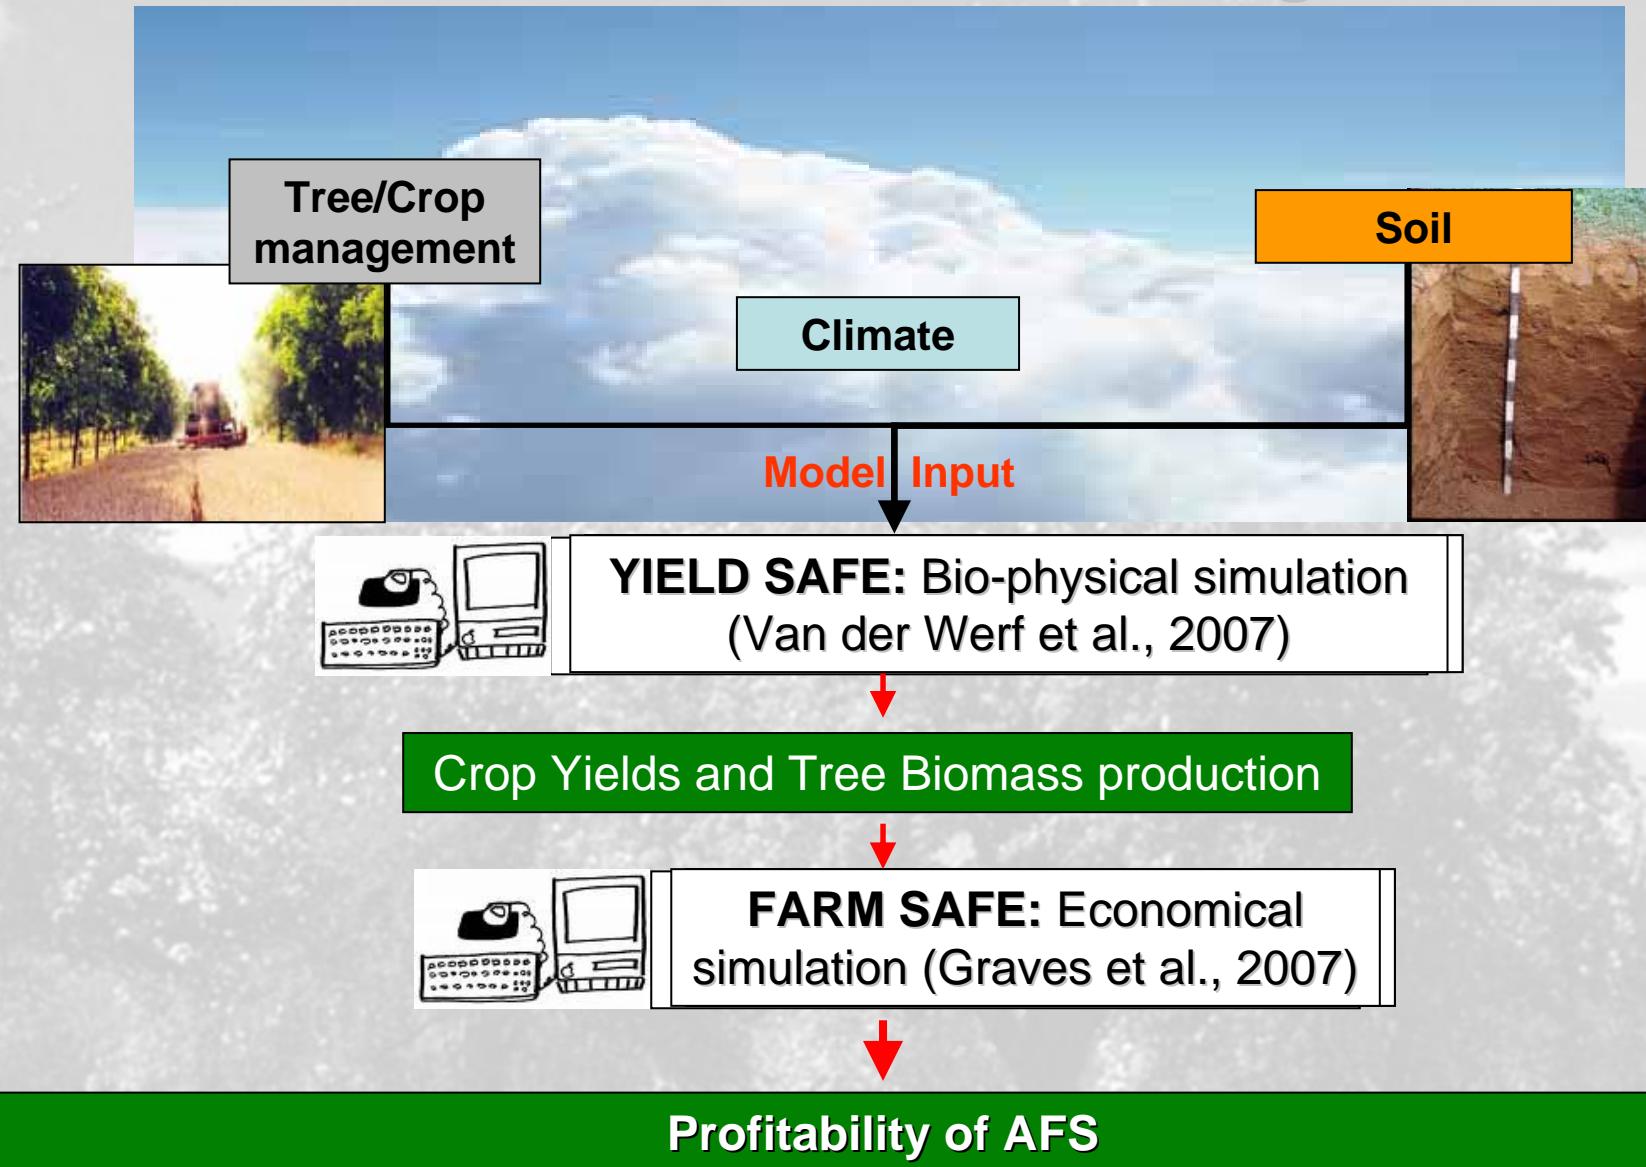

- **How to assess temperate AFS?**
- **What are the long term yields?**
- **Is agroforestry profitable in Switzerland?**

Method (ii): Bio-economic modeling

Assessing the long-term yields and profitability of AFS compared to arable and forestry systems.

- **Land use scenarios will be developed** and evaluated, integrating the knowledge of different actors;
- **Recommendations** for land users shall be derived.

Bio-economic modelling

Design

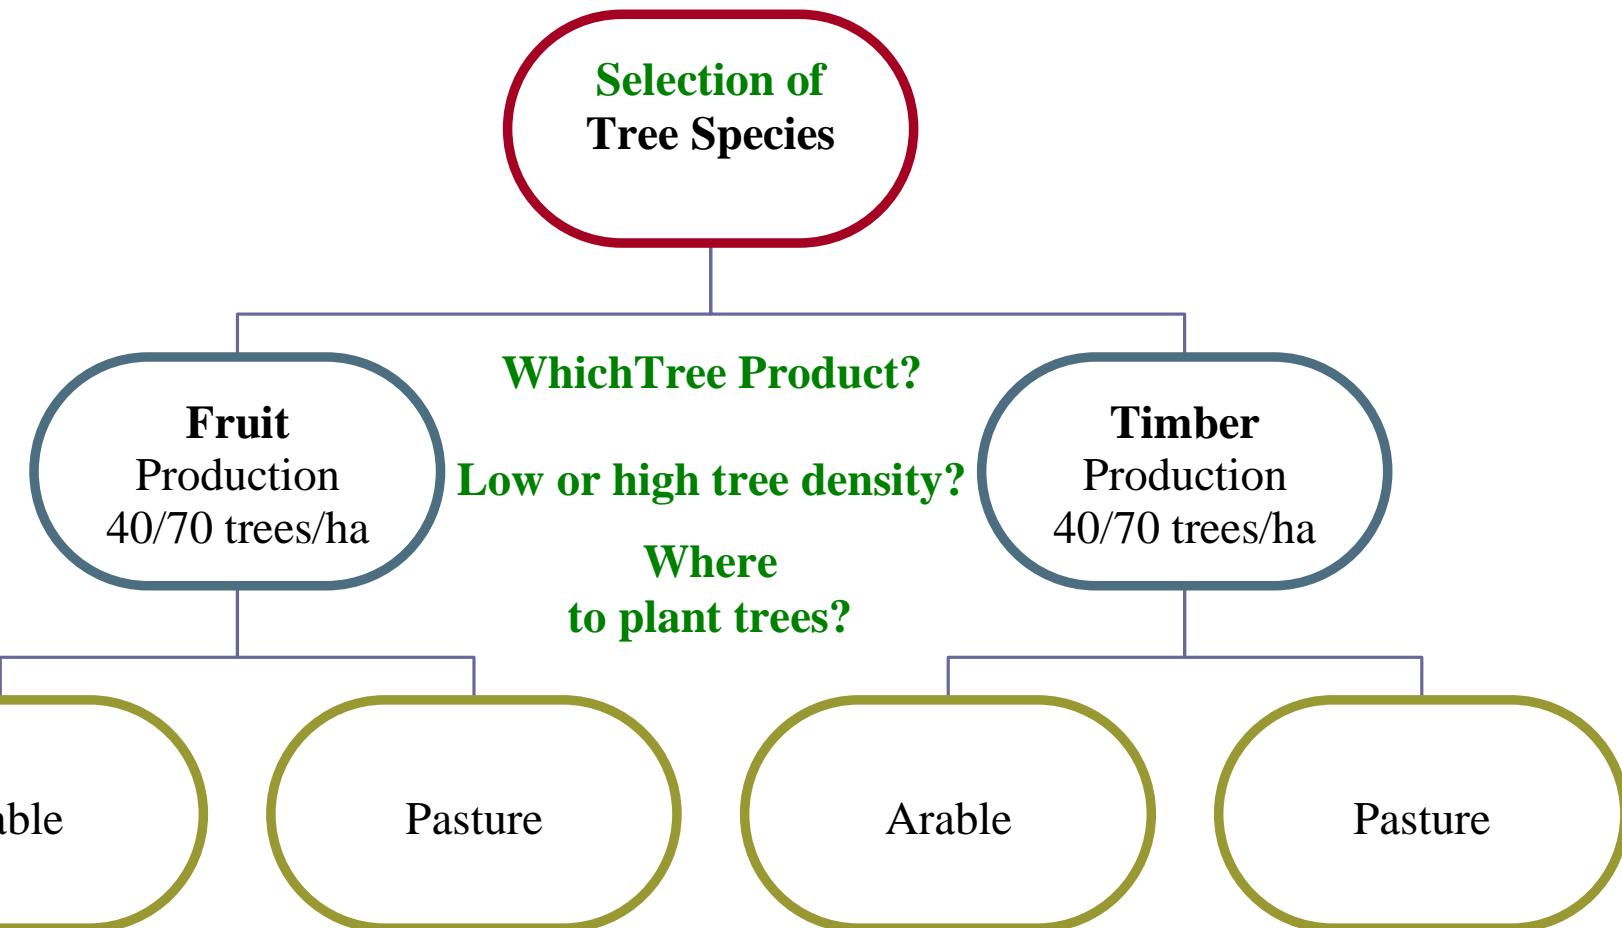

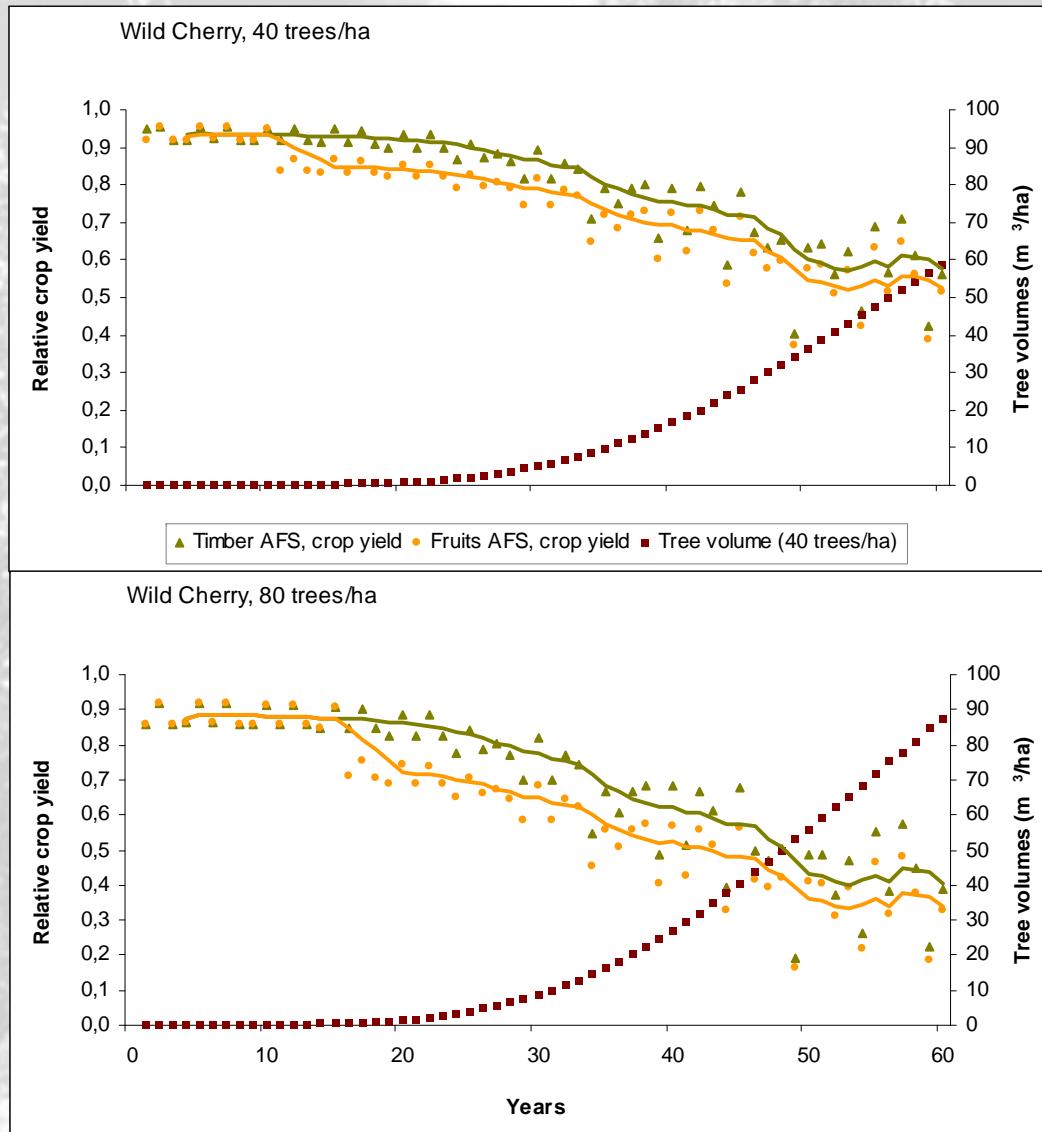

Figure - Tree integration options

Design

System	Agroforest				Forest			
	Planting scheme	Intercropped alley	Intercropping area	Density (trees/ha)	Density (trees/ha)			
	m	m		initial	final	Walnut	Wild cherry	final
Timber	26x10	24	0.92	40	200	100	800	150
Timber	14x10	12	0.86	70				
Fruit	28x10	24	0.84	40				
Fruit	16x10	12	0.72	70				

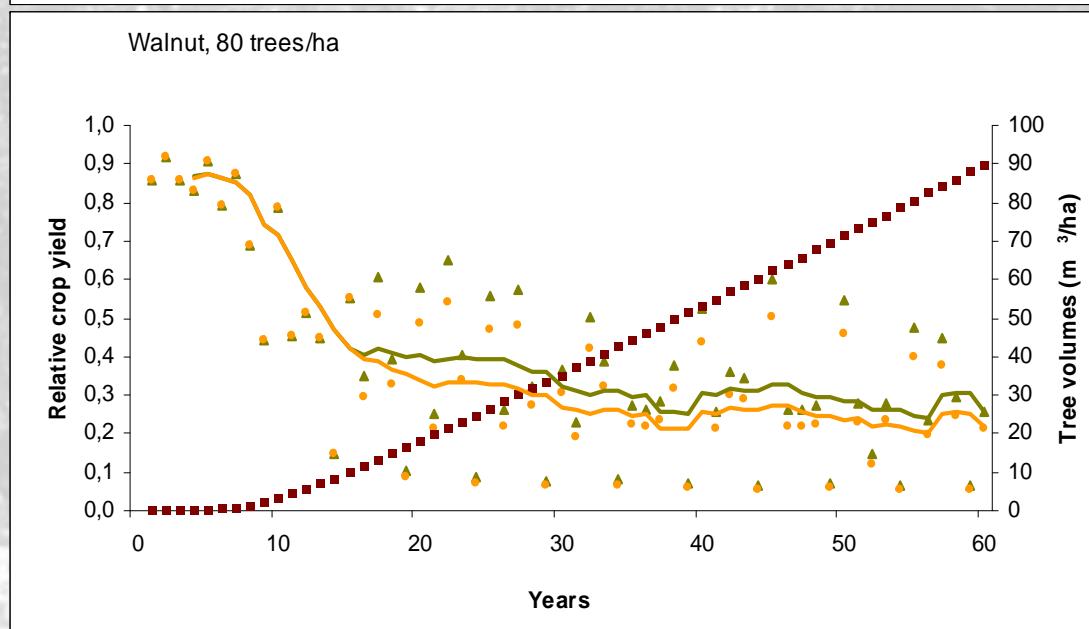

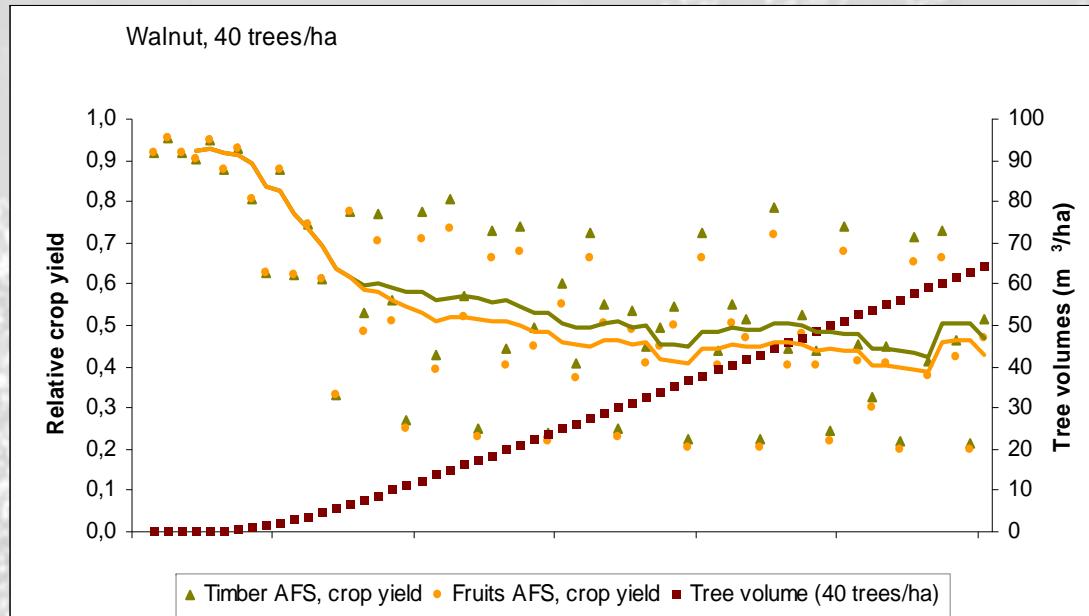

Preliminary simulation results

Yield Simulation

Preliminary simulation results

Yield Simulation

Land equivalent ratio (LER)

**LER is the relative land area in pure stands
that is required to produce the yields of all
products from the mixed system**

LER = 1

LER > 1

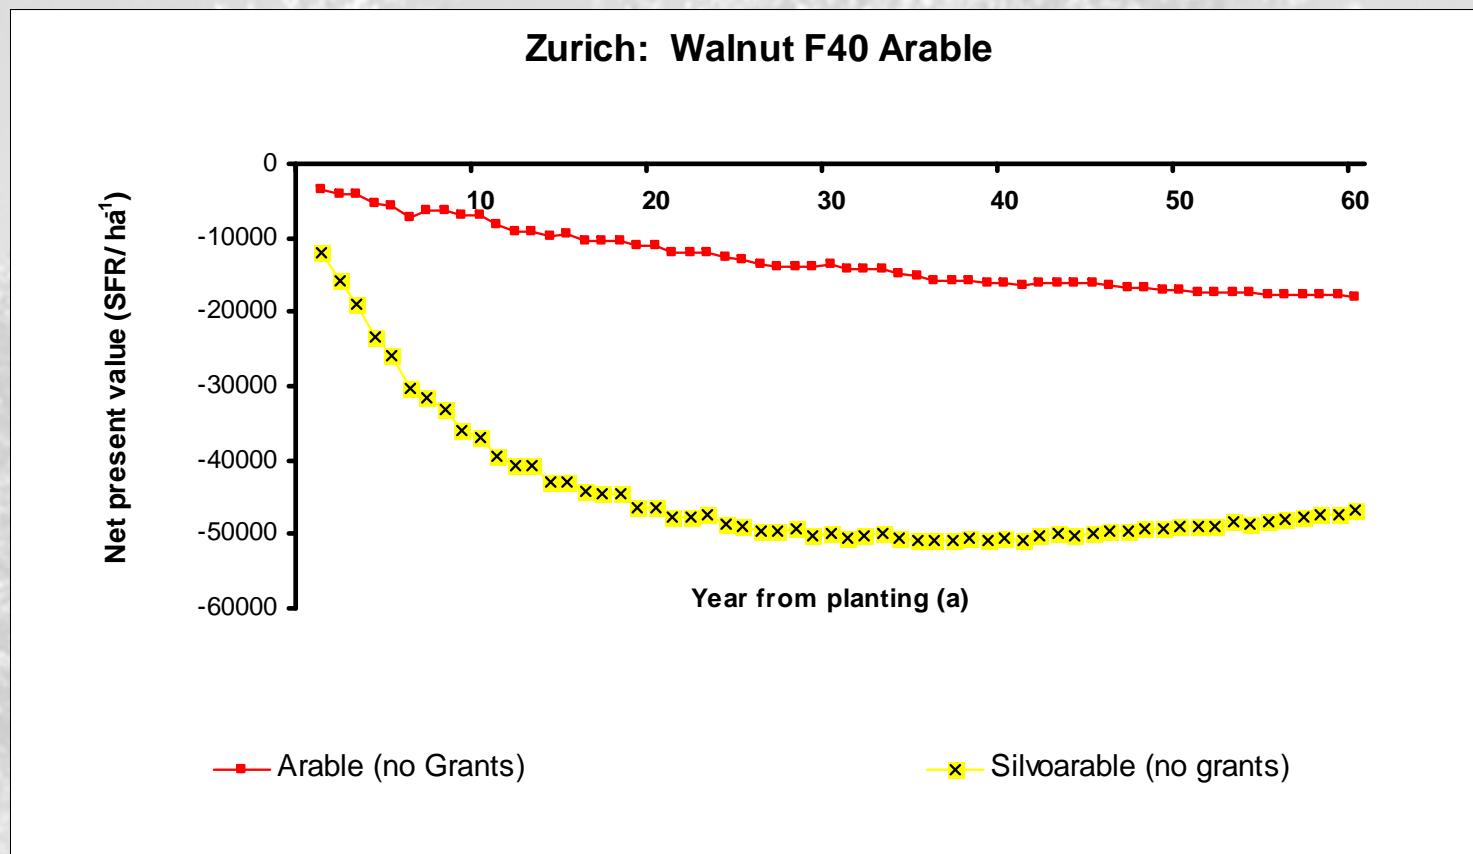

Swiss Wild Cherry systems: LER = 1,06 – 1,35

Swiss Walnut systems: LER = 0.85-1,25
(winter crops > summer crops)

First conclusions & outlook

- Based on the survey and literature a land use database has been established (crop/tree management, climate, soils, costs, revenues and grant regimes)
- Modern AFS were designed based on local management practices
- The Bio-physical model has been calibrated to Swiss conditions and long term yields simulated
- Competition for resources increase with time, management and design play an important role
- LER > 1 in most simulated systems, indicates a more efficient use of resources in AFS compared to pure stands
- Various Economic Land use Scenarios were produced
- Establishment grants are important to make tree planting more attractive
- The expected results should provide more information on tree based farming systems and tree policy
